●LED Operation Mode Table

PWDOWN (5pin)	TX-RC (4pin)	TXD (7pin)	LED Emitting Mode	IrDA Receiver Operation Condition
L	L	L	OFF	ON
L	L		IrDA	ON
L		L	RC	ON
H	L	L	OFF	OFF
H	L		OFF	OFF
H		L	RC	OFF

- Notes
- Please be sure to set up the TX-RC (2pin) and the TXD (3pin) input to be "L" (under 0.3V) except transmitting data (for <math>< 90\mu\text{s}</math>. ON Duty $\leq 50\%$).
 -  of TX-RC (2pin) and TXD (3pin) in the table above is supposed to be the pulse input.
 - When either TX-RC (2pin) input TXD (3pin) input keeps the state of "H" (more than approximately 48 μs), LED will be turned off due to LED pulse width limiting circuit if the pulse is input from the other terminal. Therefore, don't use as the normal transmitting is impossible.
 - Please input the pulse when both TX-RC (2pin) and TXD (3pin) are "L".
 - Even if RPM841-H16 input H pulse into TXD in the state of a power down, LED does not emanate.

●Interface operating timing

(Emitting side)

Input			Condition	
PWDOWN	TX-RC	TXD	LED Mode	Receiver circuit
L	L	L	OFF	ON

H		L	RC	OFF
H	L	L	OFF	OFF

*If TX-RC or TXD input pulse width is wider than 48µs, output LED emitting pulse will be turn off approximately 48µs.

(Receiving side)

*RXD output width is fixed approximately 2.6µs.

Note RXD output become stable after 200µs since PWDOWN is changed from H to L.
RXD output could be unstable at H to L within 200µs.

Recommended values

Part symbol	Recommended value	Notice
C1	1μF, tantalum or ceramic Ex.) TCFGA1A105M8R (ROHM)	Bigger capacitance is recommended with much noise from power supply
R1	2.2Ω±5%, 1/8W (VLEDV _{cc} =3V)	At LED Emitting Duty=25%

[LED current set-up method for Remote control mode]

In case of using R1 with different condition from the above, formula is as follows :

LED resistance value : R1[Ω], LED average consumption current : ILED[mA], Supply voltage : VLEDV_{cc}[V],

minimum necessary of irradiant intensity Ie1 [mW / sr]

(Including LED's distribution within ±15deg)

$$R1=166 \times (VLEDV_{cc}-1.31) / Ie1-7.2$$

$$ILED=Duty \times (VLEDV_{cc}-1.31) / (R1+5.8)$$

Duty : LED duty at emitting

* Please set up to be $ILED / Duty < 250[mA]$ (Duty ≤ 25%)

* At IrDA Mode, LED current is constantly approximately 50mA.

(Reference) In case of using R1, typical intensity (Ie1typ) and maximum intensity (Ie1max) on axis are described as below.

$$Ie1typ=280 \times (VLEDV_{cc}-1.31) / (R1+5.8)$$

$$Ie1max=560 \times (VLEDV_{cc}-1.31) / (R1+5.8)$$

●Notes

1) LEDV_{cc} (1pin), V_{cc} (6pin)

- Other power source can be used difference between LEDV_{cc} and V_{cc}.

2) Caution in designing board lay-out

To get maximum potential from RPM841-H16, please keep in mind following instruction.

- The line of RXD (4pin) should be connected at backside via through hole close to RPM841-H16 pin lead. Better not to be close to photo diode side (7pin).

⇒This is to minimize feedback supplied to photo diode from RXD.

- As for C1 between 6-7 pin should be placed close to RPM841-H16.
- Better to be placed more than 1.0cm in radius from photo diode (pin7 side) and also away from the parts which generates noise, such as DC/DC converter.

3) Notes

- Please be sure to set up the TX-RC (2pin) and the TXD (3pin) input to be "L" (under 0.3V) except transmitting data (for < 90μs, ON duty ≤ 50%).
- Power down current might increase if exposed by strong light (ex. direct sunlight) at powerdown mode.
- Please use by the signal format at IrDA operating mode which is specified by IrDA Ver1.2 (2.4k to 115.2kbps). There might be on error if used by different signal format.
- Please pay attention to the lens carefully.
Dusts of scratch on the lens may effect the characteristics of product. Please handle it with care.
