Linear array thermopile system with digital output

TSEM 0108-L

Function principle:

Thermopiles transform incoming heat radiation from an object to an outgoing voltage, which is correlated to the object temperature. This IR sensor is based on an 8 element linear array thermopile chip. The integrated silicon lens generates 8 individual FOV (field of view) to measure the temperature profile along a straight line at 8 separate points. The integrated multiplexer connects selected pixels to the output channel. The object temperature is calculated digitally by a microcontroller. The calculated temperature are transmitted by an I²C output interface. The system is calibrated and compensated for ambient temperature effects and can be adapted for different emissivity factors.

Applications

- Home appliances (Microwave oven)
- Medical (Skin temperature)
- Automotive (Air conditioning)
- Security (Presence detection)

Advantages

- Small size
- Easy to integrate
- Low cost unit
- Low vibration sensitivity

Specification

	<i>Conditions</i>	<i>Min</i>	<i>Typ</i>	<i>Max</i>	<i>Unit</i>
<i>Object temperature range</i> ¹⁾		0		+150	°C
<i>Accuracy</i>			2		% of FS
<i>Resolution (digital)</i>			0.5		°C
<i>Data output rate</i>			10		Hz
<i>FOV</i>			20		°
<i>Power voltage supply</i>		4,75	5	5,25	VDC
<i>Current consumption</i>			6		mA
<i>Operation temperature range</i>		0		+85	°C
<i>Storage temperature range</i>		-40		+105	°C
<i>Dimensions</i>	<i>W x D x H</i>		25 x 25	x 19	mm
